Do you have to make separate exploding codes for root canal anterior versus molars service codes?

The Smart Codes in Eaglesoft make it unnecessary to create multiple exploding codes. Once the tooth number is placed in the treatment plan, the code will switch from an anterior tooth to the code matching the tooth number.

For example, if you type in Tooth #14, the code changes to D3330; if it’s tooth #12 the code changes to D3320. There is an excel spreadsheet on FAQ #4682 showing which codes should be set up with smart codes.

Will Eaglesoft auto change the codes per root?

The code changes by tooth number, not by root. A tooth number must be chosen for the smart code to work. You could use the example in the comment above to explain.
